

WordPress hosting with AWS RDS

Description & Core Requirements:

- i. Launch an AWS EC2 instance (OS can choose by your choice).
- ii. Host WordPress files under a user directory.
- iii. Create an RDS instance.
- iv. Connect RDS Database with your WordPress and run webpage using URL myawshosting.net.

NB: Only Minimum access is granted.

Part 1 - WordPress Hosting with Local MariaDB

Objective: Host WordPress on an EC2 instance using Apache, PHP and MariaDB.

1. Launch EC2 Instance

- **OS:** RHEL 9 / Amazon Linux
- **Security Group:** SSH 22, HTTP 80, HTTPS 443

2. Install Apache

```
sudo -i
dnf update -y
dnf install httpd -y
systemctl enable --now httpd
systemctl status httpd
```

3. Install PHP

```
dnf install php php-mysqlnd php-gd php-mbstring php-xml php-json php-curl php-zip wget
tar -y
php -v
```

4. Install MariaDB

```
dnf install mariadb-server -y
systemctl enable --now mariadb
```

5. Create Database

```
mysql
CREATE DATABASE wordpressdb;
CREATE USER 'wpuser'@'localhost' IDENTIFIED BY 'StrongPassword123!';
GRANT ALL PRIVILEGES ON wordpressdb.* TO 'wpuser'@'localhost';
FLUSH PRIVILEGES;
EXIT;
```

6. Create User Directory

```
useradd wordpressuser
mkdir -p /home/wordpressuser/public_html
chmod 755 /home/wordpressuser
chmod 755 /home/wordpressuser/public_html
```

7. Download WordPress

```
cd /home/wordpressuser
wget https://wordpress.org/latest.tar.gz
tar -xzf latest.tar.gz
cp -r wordpress/* public_html/
```

8. Apache VirtualHost

Configuration File Location: /etc/httpd/conf.d/myawshosting.conf

```
<VirtualHost *:80>
    ServerName mywordpress.net
    DocumentRoot /home/wordpressuser/public_html
    <Directory /home/wordpressuser/public_html>
        AllowOverride All
        Require all granted
    </Directory>
</VirtualHost>
```

9. SELinux

```
setsebool -P httpd_enable_homedirs on
chcon -R -t httpd_sys_content_t /home/wordpressuser/public_html
```

10. Configure WordPress

```
cp wp-config-sample.php wp-config.php
DB_NAME=wordpressdb
DB_USER=wpuser
DB_PASSWORD=StrongPassword123!
DB_HOST=localhost
```

11. Restart Apache

```
systemctl restart httpd
```

12. Complete installation in browser.

Part 2 - WordPress Hosting using Amazon RDS

Objective: Host WordPress files on EC2 and database on Amazon RDS.

1. Launch New EC2 Instance

Install Apache and PHP as structured in Part 1.

2. Deploy WordPress Files

Create directory path /home/wordpressuser/public_html. Download and extract WordPress source components.

3. Create Amazon RDS

- **Engine:** MySQL
- **Creation Method:** Full Configuration
- **DB Identifier:** wordpressdb
- **Master User:** admin
- **Initial Database Name:** wordpressdb
- **Public Access:** Yes (Lab)
- **Port:** 3306

4. Security Group

Create a new security group named wordpress-rds-sg. Allow inbound MySQL/Aurora traffic on port 3306 strictly sourced from your frontend EC2 Security Group.

5. Get Endpoint

Example Endpoint Layout: wordpressdb.xxxx.ap-south-1.rds.amazonaws.com

6. Install MySQL Client

```
dnf install mariadb -y
```

7. Test Connectivity

```
mysql -h ENDPOINT -u admin -p wordpressdb  
SHOW DATABASES;
```

8. Configure WordPress

File modified inside /home/wordpressuser/public_html:

```
cp wp-config-sample.php wp-config.php  
define('DB_NAME','wordpressdb');  
define('DB_USER','admin');  
define('DB_PASSWORD','YOUR_PASSWORD');  
define('DB_HOST','RDS-ENDPOINT');
```

9. Important SELinux Fix

```
setsebool -P httpd_can_network_connect on
```

10. Restart Apache

```
systemctl restart httpd
```

11. Complete WordPress Installation

Open your web browser interface and complete the wizard deployment using the target configurations:

- `http://PUBLIC-IP`
- `http://myawshosting.net` (Updated to fit description requirements)

12. Verify Tables

```
mysql -h ENDPOINT -u admin -p wordpressdb  
SHOW TABLES;  
SELECT * FROM wp_users;
```

Troubleshooting Framework

403 Forbidden Response Error:

- `chmod 755 /home/wordpressuser`
- `setsebool -P httpd_enable_homedirs on`

Database Connection Failure Errors:

- Check `DB_HOST` endpoint matches correctly.
- Check administrative password configurations.
- Cross-examine active inbound RDS security group rules.
- Enable: `setsebool -P httpd_can_network_connect on`

Apache Validation Checks:

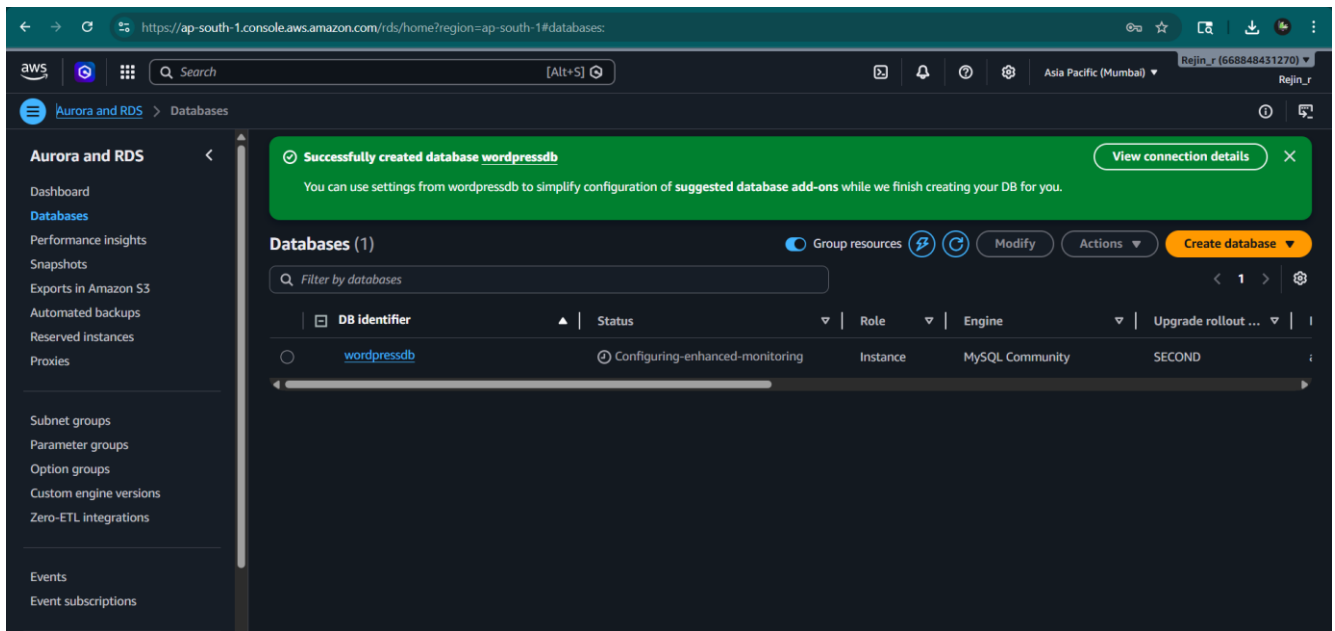

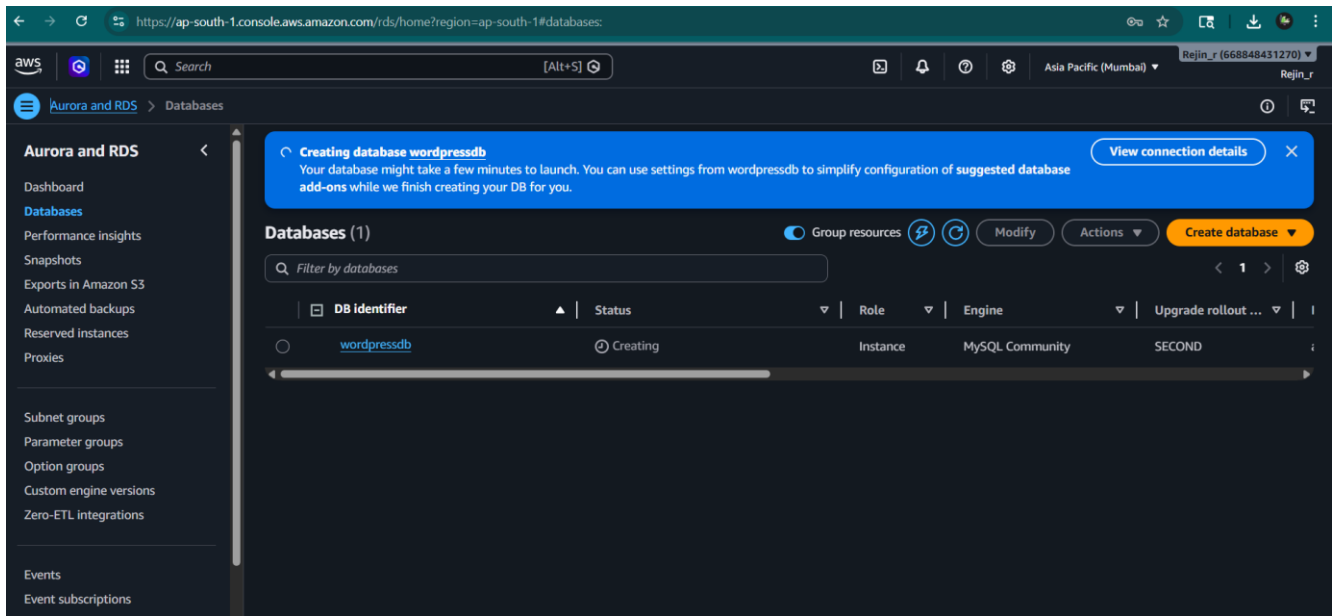

- `httpd -t`
- `httpd -S`

System Log Inspection:

- `tail -f /var/log/httpd/error_log`

WordPress URL Hard-Fix Routing:

- `SELECT option_name,option_value FROM wp_options WHERE option_name IN ('siteurl','home');`
- `UPDATE wp_options SET option_value='http://PUBLIC-IP' WHERE option_name='siteurl';`
- `UPDATE wp_options SET option_value='http://PUBLIC-IP' WHERE option_name='home';`

Connect using Info

- ☐ Code snippets
Use when connecting through SDK, APIs, or third-party tools including agents.
- ☐ CloudShell
Use for a quick access to AWS CLI that launches directly from the AWS Management Console.
- ☒ Endpoints
Use when connecting through any IDE interface.

Database name
mysql

Master username
admin

Internet access gateway
Disabled

Port
3306

Endpoint type
Instance endpoint

Welcome

Welcome to the famous five-minute WordPress installation process! Just fill in the information below and you'll be on your way to using the most extendable and powerful personal publishing platform in the world.

Information needed

Please provide the following information. Do not worry, you can always change these settings later.

Site Title

Username

Names can have only alphanumeric characters, spaces, underscores, hyphens, periods, and the @ symbol.

Password

Strong

Important: You will need this password to log in. Please store it in a secure location.

Your Email
