

# Save an Elastic Beanstalk Environment Configuration and load it after making few changes

*AWS Elastic Beanstalk Lifecycle & Configuration Management Guide*

## Description & Objectives:

1. Create a running environment inside the AWS Elastic Beanstalk console.
2. Target the newly created environment for architectural or configuration changes, and systematically save the updated configuration state once all alterations are finalized and validated.

## 1. Deployment Prerequisites

Before initiating the setup, ensure that your AWS environment satisfies the following baseline management criteria:

- Active AWS Account with access to the AWS Management Console.
- IAM User Permissions explicitly granting lifecycle management for AWS Elastic Beanstalk, EC2 instances, and Identity and Access Management (IAM) role assignments.
- Pre-configured default Virtual Private Cloud (VPC) availability in the targeted deployment region.

## 2. Step-by-Step Environment Provisioning

1. **Application Initialization:** Log into the AWS Management Console, navigate to the Elastic Beanstalk service, and select 'Create Application'. Configure the application name as 'sample-beanstalk-app'.
2. **Platform & Web Server Selection:** Designate the Environment Tier as a 'Web server environment'. Select 'PHP' as the official platform and specify the Application Code as 'Sample Application' to deploy a verified baseline infrastructure.
3. **Service Access & Role Assignment:** Configure required security principles. Attach the service role 'aws-elasticbeanstalk-service-role' (with AWSElasticBeanstalkEnhancedHealth and AWSElasticBeanstalkManagedUpdates CustomerRolePolicy). Map the EC2 Instance Profile to 'aws-elasticbeanstalk-ec2-role' granting AWSElasticBeanstalkWebTier, WorkerTier, and MulticontainerDocker privileges.

4. **Networking & Scale Settings:** Utilize the default regional VPC and subnets. Set the Environment Type to 'Single Instance' and pick cost-effective capacity profiles such as 't2.micro' or 't3.micro'. Leave Database settings blank and keep defaults for Logging/Monitoring.
5. **Review & Create:** Execute a rigorous validation review of all parameter blocks on Step 7. Click 'Create Environment' and monitor progress until status resolves to 'Ready' and Health changes to 'OK'.

### 3. Post-Deployment Verification & Testing

To confirm operational integrity prior to saving configurations or enacting design changes, perform the following validation lifecycle:

- Launch the auto-generated environment URL from the Beanstalk Dashboard.
- Verify that the sample PHP splash page renders without HTTP errors.
- Confirm the general dashboard Health Status reads a stable 'OK'.
- Inspect the 'Events' tab to ensure clean logs showing successful deployment messages.

### 4. Saving and Modifying Environment Configurations

Elastic Beanstalk allows you to capture configuration states as reusable templates. Follow this sequence to secure your baseline or updated environments:

#### 4.1 Saving the Current State

6. Open the running Environment Dashboard for **sample-beanstalk-app**.
7. Navigate to the top-right menu and click **Actions** → **Save Configuration**.
8. Provide a descriptive tracking moniker in the dialog box (e.g., *sample-config*) and commit the template.

#### 4.2 Modifying and Loading Configurations

When updates (such as scaling changes, environment variables, or platform updates) are applied to the active environment, you can quickly restore or shift back using your saved templates:

- Apply required changes directly via the 'Configuration' menu in the left navigation sidebar.
- To re-load or apply a previously saved state, navigate back to the Application level screen.
- Select 'Saved configurations', pick your desired configuration template (e.g., *sample-config*), and click 'Load' to cleanly apply those precise parameter matrices to your active infrastructure.

### 5. Final State Verification Checklist

| Verification Milestone | Status |
|------------------------|--------|
|------------------------|--------|

Environment Provisioned Successfully

✓ **Verified**

Sample PHP Application Deploying & Running

✓ **Verified**

Public Environment URL Publicly Accessible

✓ **Verified**

Health Status Resolving to 'OK'

✓ **Verified**

Baseline Configuration Saved Template Generated

✓ **Verified**

Environment successfully launched.

### Sample-beanstalk-app-env

**Environment overview**

Health: Ok

Domain: Sample-beanstalk-app-env.eba-ugmy3t5r.ap-south-1.elasticbeanstalk.com

Environment ID: e-fi7rwxmfwz

Application name: sample-beanstalk-app

**Platform**

Platform: PHP 8.5 running on 64bit Amazon Linux 2023/4.13.1

Running version: -

Platform state: Supported

**Events (11)**

| Time                             | Type | Details                                                     |
|----------------------------------|------|-------------------------------------------------------------|
| June 3, 2026 14:53:12 (UTC+5:30) | INFO | Successfully launched environment: Sample-beanstalk-app-env |

**AWS Elastic Beanstalk**

## Welcome to Your Elastic Beanstalk Application

Congratulations! Your PHP application is now running on your own dedicated environment in the AWS Cloud.
